

Dolphin Social Collaborator

Snapshot for 1_supporting · based on recent class records

Across recent ClassZ records, your child was often observed as collaborates well, participates actively, and hesitant with new tasks.

Based on 8 recent learning records. Similar learning patterns have appeared repeatedly across the recent records.

Your child may learn best through interaction, shared practice, encouragement, and group-based learning. They may become more engaged when learning feels social, supportive, and connected with others.

They may show progress when they can discuss, cooperate, observe peers, or receive feedback in an encouraging environment.

This does not mean 1_supporting always learns this way. It is a recent snapshot based on repeated coach and tutor observations.

OFTEN OBSERVED AS

Collaborating well

Participating actively

Responding well to feedback

Engaging with others during learning

WHAT MAY HELP

- ~ Encourage group practice or partner activities.
- ~ Give opportunities to explain ideas to others.
- ~ Use positive social encouragement.
- ~ Help them balance teamwork with independent practice.
- ~ Praise cooperation, listening, and contribution.

WHY WE THINK THIS

This is grounded in social learning theory and developmental psychology, where children often learn through observing others, interacting with peers, and receiving social feedback from adults and classmates.

This is not a diagnosis or a fixed personality label — it's a recent snapshot based on ClassZ records, and it may change as your child joins more classes and receives more feedback.

Also reflected in 1_supporting's learning

T Turtle Steady Builder

In a couple of STEM sessions, your child showed some hesitation when starting new tasks, needing a little extra encouragement to get going. This pattern appeared alongside their usual collaborative and active participation, suggesting that while they thrive in social learning, they sometimes benefit from a gentle push when faced with unfamiliar material.

Personalised interpretation

Your child's current learning portrait

Across recent STEM sessions, your child has consistently worked well with others and shown a confident willingness to try new activities. They have moved from needing close support to completing tasks independently, while always collaborating effectively. In a couple of sessions, they were a bit hesitant with new tasks, but this did not stop them from participating actively overall.

How they approach something new

Your child generally approaches new activities with confidence and a willingness to try, as seen across many STEM sessions. However, on a couple of occasions they were hesitant when starting something new, needing a bit more encouragement to begin. This suggests that while they are usually ready to dive in, unfamiliar tasks can sometimes make them pause.

How they respond to challenge

When faced with challenges, your child tends to persist and participate actively, often collaborating with others to work through difficulties. Their confidence to try new things helps them engage even when tasks are demanding. There is not yet enough evidence to describe how they respond to sustained difficulty or repeated setbacks.

How they learn with other people

Your child learns very well with others, consistently working collaboratively and participating actively in group settings. Every record shows they worked well alongside peers, making social interaction a key part of their learning. This strength has been present across all recent STEM sessions.

How they respond to guidance and feedback

Your child responds well to feedback, as noted in one session where they adapted after receiving encouragement. Their confidence to try suggests they are open to guidance, but there is limited direct evidence about their response to constructive criticism or correction.

Conditions that bring out their best

Your child thrives in collaborative, supportive environments where they can work with others and receive positive encouragement. They have shown consistent progress from supported to independent work in STEM, indicating that structured guidance helps them build confidence and skill. A gentle nudge may be helpful when they appear hesitant with new tasks.

What parents may notice at home

At home, you might see your child enjoy explaining ideas or practicing with others, as they learn well through interaction. They may sometimes need a little encouragement to start a new activity, but once engaged, they show confidence and persistence. Their focus on technique and control suggests they value doing things carefully.

Personalised strategies

- Encourage group practice or partner activities to build on their collaborative strength.
- Give a gentle nudge and positive encouragement when starting unfamiliar tasks.
- Praise their cooperation, listening, and contribution to reinforce social learning.
- Help them balance teamwork with independent practice to build self-reliance.

What ClassZ will continue observing

- How they handle increasingly independent tasks across different subjects.
- Whether hesitation with new tasks appears in other contexts or diminishes over time.
- How their focus on technique and control develops as they take on more complex challenges.
- Their response to feedback in a wider range of learning situations.

Evidence and confidence

Similar learning patterns have appeared repeatedly across the recent records, with a consistent theme of collaboration and confidence. The evidence is based on 8 valid records, all in STEM, showing a clear and repeated pattern. While the portrait is well-supported, it remains a snapshot and may evolve with more diverse experiences.
